

(a) Microscopic model

i vacuum reference shown; displaced, thermal, or squeezed references require modified encoding and noise operators
default fast reference: mediator vacuum

(c) Encoding, reconstruction, and initial layer

- bare vacuum is not exactly the instantaneous slow-manifold embedding
- the mediator develops a small conditional occupation
- displaced, thermal, or squeezed mediators require modified encoding and noise operators

(b) One susceptibility, two effective resources

(d) Validity and structural breakdown
